Application recommendation

The user has the choice as to which backlash-free shaft coupling is used on a servo drive. For that purpose KTR provides for four different types of couplings: ROTEX® GS, COUNTEX®, TOOLFLEX® and RADEX®-NC. Dependent on the required torsional stiffness of the complete system you choose the best coupling for your individual application.

ROTEX® GS Backlash-free, flexible jaw-type coupling

- ability for axial plug-in
- high power density
- adjustment of damping through different elastomer hardness of the spiders

Shaft encoders, miniature drives	+	
Ball screws, synchronous belt drives		
Low backlash/backlash-free gears		
Main spindle drives		

- compact design, easy assembly/disassembly, electric insulation
- high power density, adapted torsional stiffness, damping vibrations, for thread drives with pitch < 40 (otherwise an inspection by KTR is necessary)
- high power density, easy blind assembly/disassembly, fail-safe, suitable for average to high gear ratios $i \geq 7$, temperature range 80°C at the maximum
- high power density, good concentric running properties of the clamping ring hubs, damping vibrations with interrupted cutting, higher accuracy of the ROTEX® GS-P design for HSC machining

COUNTEX® Backlash-free shaft encoder coupling

- ability for axial plug-in
- double-cardanic
- temperature-resistant

Shaft encoders, miniature drives	+	
Ball screws, synchronous belt drives		
Low backlash/backlash-free gears		
Main spindle drives		

- double-cardanic type to compensate for larger displacements, constant torsion spring stiffness also with higher temperatures

TOOLFLEX® Backlash-free, torsionally stiff metal bellow-type coupling

- non-positive bellow-hub connection
- frictionally engaged clamping hubs

Shaft encoders, miniature drives	+	
Ball screws, synchronous belt drives		
Low backlash/backlash-free gears		
Main spindle drives		

- compact flexible coupling with low radial restoring forces
- suitable if higher torsional stiffness is required, e. g. high pitch with threaded spindle drives $s \geq 40$, constant torsional stiffness with high temperatures
- suitable if higher torsional stiffness is required, e. g. gear ratios $i < 7$, constant torsional stiffness with high temperatures
- high torsional stiffness, for main spindle drives subject to critical resonances

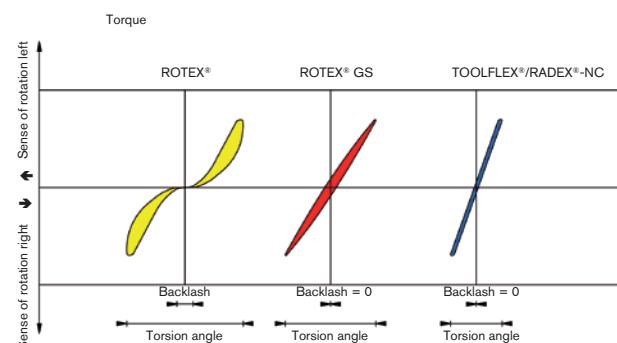

RADEX®-NC Backlash-free, torsionally rigid servo lamina coupling

- compact design
- higher torsional stiffness
- frictionally engaged clamping hubs

Shaft encoders, miniature drives	+	
Ball screws, synchronous belt drives		
Low backlash/backlash-free gears		
Main spindle drives		

- double-cardanic design to compensate for bigger displacements
- suitable if higher torsional stiffness is required, e. g. high pitch with threaded spindle drives $s \geq 40$, constant torsional stiffness with high temperatures
- suitable if higher torsional stiffness is required, e. g. gear ratios $i < 7$, constant torsional stiffness with high temperatures
- high torsional stiffness, for main spindle drives subject to critical resonances, for high torques type RADEX®-N is available: TKN up to 280.000 Nm

The diagram alongside this text clarifies the influence of the ROTEX®, ROTEX® GS, RADEX®-NC and the TOOLFLEX® couplings regarding backlash and torsion angle. Due to the high stiffness of the RADEX®-NC and the TOOLFLEX® the torsion angle is very low under torque. However, contrary to the flexible ROTEX® and the backlash-free ROTEX® GS a damping of torsional vibrations etc. is not possible.

Technical description

ROTEX® GS is a 3-part, axial plug-in coupling backlash-free under prestress. It is convincing even with critical applications by its backlash-free power transmission, its stiffness which is each adapted to the application and its optimum damping of vibrations. This principle of installation offers significant assembly possibilities which optimize the assembly times in production.

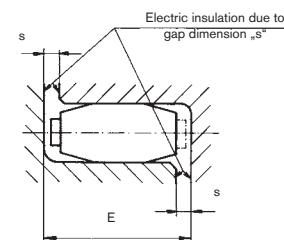

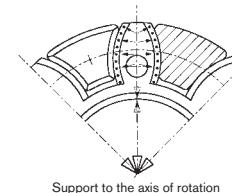

ROTEX® GS (straight tooth, backlash-free)

The straight toothing of the spider mounted under prestress results in a smaller surface pressure and consequently higher stiffness of the coupling system. The flexible teeth compensate for misalignment but are supported radially in the inside diameter by a central web. This avoids too high internal or external deformation by high acceleration or high speeds. This is vital for a smooth operation and long service life of the coupling.

The pegs arranged reciprocally on the spider prevent the spider from touching the hub over the entire surface. Observing the distance dimension E ensures the ability of the coupling to compensate for displacements.

By observing the gap dimension „s“ the electrical insulation is ensured, as well as a high service life of the coupling. This fact is gaining more and more importance, due to the increasing precision of shaft encoders and the existing demand for electro-magnetic compatibility.

Limitation by concave cams in case of too high speeds/centrifugal forces and prestress of elastomer parts

Explosion protection use

ROTEX® GS couplings are suitable for power transmission in drives in hazardous areas. The couplings are certified and confirmed according to EC standard 94/9/EC (ATEX 95) as units of category 2G/2D and thus suitable for the use in hazardous areas of zone 1, 2, 21 and 22. Please read through our information included in the respective Type Examination Certificate and the operating and mounting instructions at www.ktr.com.

Selection: In case of use in hazardous areas the clamping ring hubs (clamping hubs without feather keyway only for use in category 3) must be selected so that there is a minimum safety factor of s = 2 between the peak torque (including all operating parameters) and the nominal torque and frictional torque of engagement of the coupling.

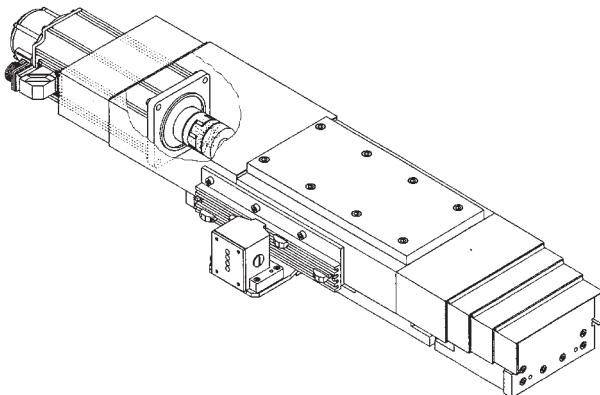

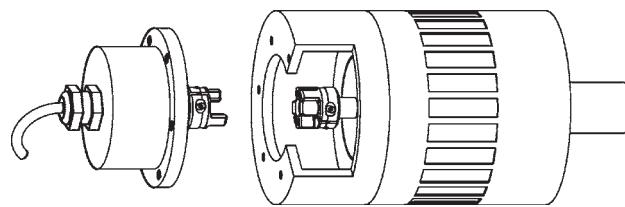

Spider						
Description of spider hardness [Shore]	Identification Colour	Material	Permissible temperature range [° C]		Available for coupling size	Typical applications
			Permanent temperature	Max. temperature short-term		
80 Sh-A-GS		Polyurethane	- 50 to + 80	- 60 to + 120	size 5 to 24	- drives of electric measuring systems
92 Sh-A-GS		Polyurethane	- 40 to + 90	- 50 to + 120	size 5 to 55	- drives of electric measuring and control systems - main spindle drives
95/98-Sh A-GS		Polyurethane	- 30 to + 90	- 40 to + 120	size 5 to 90	- positioning drives - main spindle drives - high load
64 Sh-D-H-GS		Hytral	- 50 to + 120	- 60 to + 150	size 7 to 38	- planetary gears / backlash-free gears - higher torsional stiffness / high ambient temperature
64 Sh-D-GS		Polyurethane	- 20 to + 110	- 30 to + 120	size 42 to 90	- higher load - higher torsional stiffness
72 Sh-D-H-GS		Hytral	- 50 to + 120	- 60 to + 150	size 24 to 38	- very high torsional stiffness / high ambient temperature - very high load
72 Sh-D-GS		Polyurethane	- 20 to + 110	- 30 to + 120	size 42 to 65	- very high torsional stiffness - very high load

The elastic spiders of the GS line are available in five different kinds of Shore hardness, identified by colour, the material being soft to hard. Due to these five spiders with different kinds of Shore hardness it is easily possible to adjust the ROTEX® GS regarding the torsional stiffness and the vibration behaviour to the individual conditions of an application. The flexible prestress varies depending on the coupling size, the spiders/material and the production tolerances. Resulting herefrom is the axial plug-in force starting from low as a close sliding fit or with torsionally soft spider, respectively, to heavy with high prestress or torsionally rigid spider (see mounting instruction KTR-N 45510 at www.ktr.com).

Application recommendation

Measurement and control systems

For measurement and control systems a high torsional stiffness of the coupling is required in order to obtain positioning repeatability. The torques that arise are relatively small so that backlash-free, torsionally stiff power transmission is achieved by the elastomer prestress. In order to minimize the restoring forces we would recommend the spider 80 Sh-A-GS for such applications.

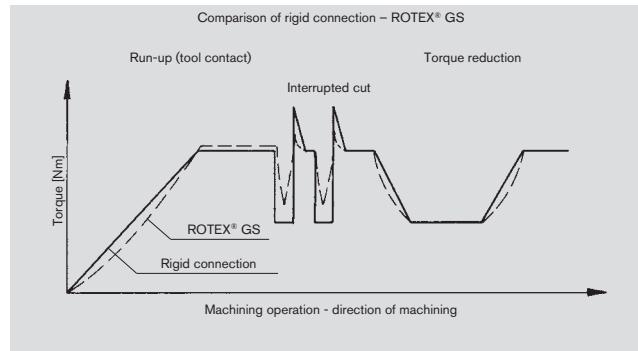

Servo and positioning drives

ROTEX® GS as an alternative to torsionally rigid couplings Torsionally rigid shaft-to-shaft connections do not only transmit the torque backlash-free and non-rigid, but also torque peaks and vibrations. For driving systems with critical vibrations, the benefit of high stiffness for torque transmission soon becomes a serious disadvantage. For applications on which torsionally rigid shaft-to-shaft connections may cause a problematic torque transmission, the optimum alternative is ROTEX® GS. Backlash-free, damping vibrations, yet sufficiently torsionally rigid so that even highly dynamic servo drives must not suffer from lower precision with the right sizing of the coupling.

Main spindle drives

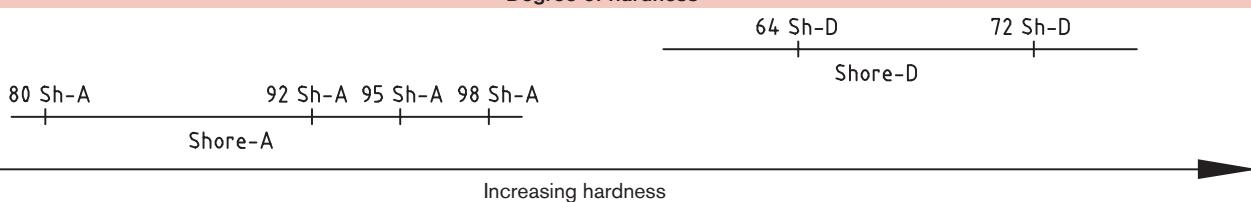

With the high torques in the field of machine tools, e. g. direct spindle drives, initial small twisting (under prestress) and damping dependent on the elastomer hardness is achieved. Peak tensions and shock loads are reduced or the resonance range is shifted to non-critical speed ranges, respectively.

For peripheral speeds up to 50 m/s (referred to the outside diameter of the coupling) we would recommend to use our ROTEX® GS clamping ring hub. For peripheral speeds exceeding 50 m/s, ROTEX® GS...P should be used. We have on hand experiences from industrial applications for peripheral speeds up to 80 m/s.

¹⁾ Static and dynamic torsional stiffness with $0,5 \times T_{KN}$

²⁾ Higher speeds on request

³⁾ With the use of the 72 Sh-D spider we would recommend to use hubs from steel

⁴⁾ Clamping ring hubs 6.0 from steel

⁵⁾ Hubs with average bore type 1.0

The coupling has to be dimensioned such that the permissible coupling load is not exceeded during any operating condition (see coupling selection on page 149-151). The torques T_{KN}/T_{Kmax} mentioned refer to the spider.

Coupling selection

1. Definitions for coupling selection

T_{KN}	- Rated torque of coupling [Nm] – Torque which can be transmitted continuously over the entire permissible speed range, taking into account the operating factors (S_t , S_d).
$T_{K \max}$	- Maximum torque of coupling [Nm] – Torque which can be transmitted over the entire service life of the coupling as dynamic load $\geq 10^5$ or as alternating load $5 \cdot 10^4$ taking into account the operating factors (S_t , S_d , S_A).
T_R	- Friction torque [Nm] – Torque which can be transmitted by the frictionally engaged shaft-hub-connection.
T_{AN}	- Constantly occurring driving torque [Nm] as per the data indicated by the engine manufacturer
T_{AS}	- Maximum driving torque [Nm] as per the data indicated by the engine manufacturer – Peak torque in case of shock by the driving A. C. motor, for example during acceleration or breakdown torque of the A. C. motor.
T_S	- Peak torque [Nm] – Peak torque on the coupling, calculated from max. driving torque T_{AS} , rotational inertia coefficient m_A or m_L and operating factor S_A .
S_t	- Temperature factor – Factor considering the lower loading capacity or larger deformation of an elastomer part under load particularly in case of increased temperatures. In case of temperatures exceeding 80 °C we would recommend to use the RADEX®-NC/TOOLFLEX®.
S_d	- Torsional stiffness factor – Factor considering the different demands on the torsional stiffness and fatigue strength of the coupling dependent on the application. In case of using the spider 64 Sh-D-GS and reversing drive S_d being at least 4 has to be selected in case of couplings made of aluminium. For positioning drives with increased demand on torsional stiffness (e. g. gearboxes with low transmission) we would recommend the use of the TOOLFLEX® or RADEX®-NC.
S_A	- Operating factor – Factor taking into account the shocks or with positioning drives the starts per minute, respectively, each depending on the application.
$m_A(L)$	- Rotational inertia coefficient of driving side (load side) – Factor taking into account the distribution of masses in case of drive and load side shocks and vibration excitation.
J_A/J_L	- Moment of inertia of the driving side/moment of inertia of the load side
$J_K/J_{M\text{ot}}/J_{Sp}$	- Moment of inertia of the coupling/moment of inertia of the motor/moment of inertia of the spindle
T_A	- Screw tightening torque [Nm]

2. Factors

Temperature factor S_t for spiders made of Polyurethane				
	-30 °C +30 °C	+40 °C	+60 °C	+80 °C

gentle shocks	≤ 60	1,0
average shocks	$\geq 60 \leq 300$	1,4
heavy shocks	≥ 300	1,8

*When using the spider 64 Sh-D-GS or 72 Sh-D-GS A factor of at least 4 or steel hubs have to be considered.

*Starts/minute

3. Calculation formula

The size of the coupling must be selected so that the following conditions are met.

$$T_{KN} \geq T_N \cdot S_t \cdot S_d$$

$$\text{and } T_{KN} \geq T_S \cdot S_t \cdot S_d$$

$$\text{Peak torque } T_S$$

For the factors please see the tables at the top.

Shock on driving side $T_S = T_{AS} \cdot m_A \cdot S_A$
Shock on load side $T_S = T_{LS} \cdot m_L \cdot S_L$

$$m_A = J_L / (J_A + J_L)$$

$$m_L = J_A / (J_A + J_L)$$

Coupling selection

4.1 Example of calculation for positioning drives

Given: Details of driving side

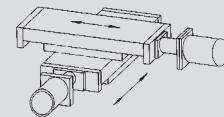

Servo Motor

Rated torque $T_{AN} = 43 \text{ Nm}$

Max. drive torque $T_{AS} = 144 \text{ Nm}$

Moment of inertia $J_{Mot} = 108 \cdot 10^{-4} \text{ kgm}^2$

Driving shaft d = 32 k6 without feather keyway

Ball screw

Ambient temperature $t = 40^\circ\text{C} \rightarrow S_t = 1,2$

60 starts / min $\rightarrow S_A = 1,0$

Machine data of driving side

Ball spindle $J_{SP} = 38 \cdot 10^{-4} \text{ kgm}^2$

Screw pitch s = 10 mm

Driven shaft d = 30 k6 without feather keyway

Mass of slide + work piece $m_{Schl} = 1030 \text{ kg}$

Required:

high torsional stiffness $\rightarrow S_d = 4$

Preliminary consideration:

ROTEX® GS clamping ring hub - axial plug-in jaw-type coupling backlash-free under prestress, with frictionally engaged shaft-hub-connection.

Moment of inertia of slide and work piece reduced to driving axis.

$$J_{Schl} = m_{Schl} \cdot (s / (2 \cdot \pi))^2 [\text{kgm}^2]$$

$$J_{Schl} = 1030 \text{ kg} \cdot (0,01 \text{ m} / (2 \cdot \pi))^2 = 26 \cdot 10^{-4} \text{ kgm}^2$$

Coupling selection

Selection according to rated torque (preliminary consideration)

$$T_{KN} \geq T_{AN} \cdot S_t \cdot S_d$$

$$T_{KN} \geq 43 \text{ Nm} \cdot 1,2 \cdot 4$$

$$T_{KN} \geq 206,4 \text{ Nm}$$

Coupling selection: ROTEX® GS 38 - 98 Sh-A-GS - $T_{KN} 325 \text{ Nm}$ with clamping ring hubs 6.0 light

Review of maximum driving torque

$$T_{KN} \geq T_S \cdot S_t \cdot S_d$$

$$T_S = T_{AS} \cdot m_A \cdot S_A$$

$$m_A = J_L / (J_A + J_K)$$

$$= 69,17 \cdot 10^{-4} / (113,17 + 69,17) \cdot 10^{-4} = 0,379$$

$$J_L = (J_{SP} + J_{Schl} + \frac{1}{2} J_K) = (38 + 26 + 5,17) \cdot 10^{-4} \text{ kgm}^2 = 69,17 \cdot 10^{-4} \text{ kgm}^2$$

$$J_A = J_{Mot} + \frac{1}{2} J_K = (108 + 5,17) \cdot 10^{-4} \text{ kgm}^2 = 113,17 \cdot 10^{-4} \text{ kgm}^2$$

$$T_S = 144 \text{ Nm} \cdot 0,379 \cdot 1,0 = 54,58 \text{ Nm}$$

$$T_{KN} \geq 54,58 \text{ Nm} \cdot 1,2 \cdot 4 \rightarrow 261,9 \text{ Nm}$$

$$\text{ROTEX® GS 38 98 Sh-A-GS } T_{KN} = 325 \text{ Nm}$$

Review of torque transmission of clamping ring hub 6.0 light for shaft diameter Ø30

$$T_R > T_{AS}$$

For figures for T_R see table on catalogue page 156.

Transmittable torque $T_R \varnothing 30 \text{ H7/k6} = 443 \text{ Nm} > 144 \text{ Nm} \checkmark$

The coupling has to be dimensioned such that the permissible coupling load is not exceeded during any operating condition.

Coupling selection

4.2 Example of calculation for main spindle drives

Given: Details of driving side

Servo Motor

Operating torque $T_{AN} = 154 \text{ Nm}$

Max. driving torque $T_{AS} = 190 \text{ Nm}$

Max. speed = 6000 rpm

Moment of inertia $J_{Mot} = 0,316 \text{ kgm}^2$

Driving shaft d = 38 k6 without feather keyway

Ambient temperature $t = 60^\circ\text{C} \rightarrow S_t = 1,4$

Moderate shocks $\rightarrow S_A = 1,0$

Details of driven side

Moment of inertia of driven side $J_L = 0,1094 \text{ kgm}^2$

Driven shaft d = 30 k6 without keyway

Required:

no special demands on torsional stiffness $\rightarrow S_d = 2$

Preliminary consideration:

ROTEX® GS clamping ring hub - axial plug-in jaw-type coupling backlash-free under prestress with frictionally engaged shaft-hub-connection.

ROTEX® GS
COUNTEX®
TOOFLEX®
RADEX®-NC

Coupling selection

Selection according to rated torque (preliminary consideration)

$$T_{KN} \geq T_{AN} \cdot S_t \cdot S_d$$

$$T_{KN} \geq 154 \text{ Nm} \cdot 1,4 \cdot 2$$

$$T_{KN} \geq 431,2 \text{ Nm}$$

Coupling selection: ROTEX® GS 42 - 98 Sh-A-GS $T_{KN} = 450 \text{ Nm}$ with clamping ring hubs 6.0 light

Review of max. driving torque

$$T_{KN} \geq T_S \cdot S_t \cdot S_d$$

$$T_S = T_{AS} \cdot m_A \cdot S_A$$

$$m_A = J_L / (J_A + J_L)$$

$$= 0,1094 / (0,1094 + 0,316) = 0,257$$

$$T_S = 190 \text{ Nm} \cdot 0,257 \cdot 1,0 = 48,83 \text{ Nm}$$

$$T_{KN} \geq 48,83 \text{ Nm} \cdot 1,4 \cdot 2 \rightarrow 136,7 \text{ Nm}$$

ROTEX® GS 42 98 Sh-A-GS $T_{KN} = 450 \text{ Nm}$

Review of torque transmission of clamping ring hub 6.0 light for shaft diameter Ø30

$$T_R > T_{AS}$$

For figures for T_R see table on catalogue page 156.

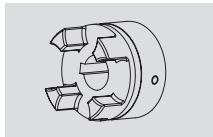

Transmittable torque $T_R \text{ Ø } 30 \text{ H7/k6} = 507 \text{ Nm} > 190 \text{ Nm} \checkmark$

The coupling has to be dimensioned such that the permissible coupling load is not exceeded during any operating condition.

Hub designs

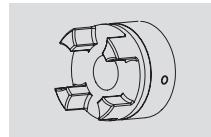

Due to the numerous applications of ROTEX® GS for many different mounting situations, this coupling system is available with various hub designs.

The different hub designs can be combined optionally within one size.

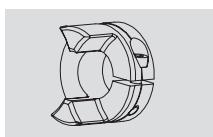

Design 1.0 with keyway and set screw

Positive locking power transmission, permissible torque depending on the permissible surface pressure. Not suitable for backlash-free power transmission with heavily reversing operation.

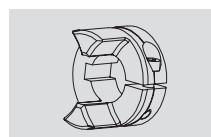

Design 1.1
without feather keyway with setscrew

Non-positive torque transmission, suitable for backlash-free transmission of very small torques. (Only for ATEX category 3)

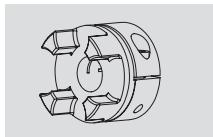

Design 2.0 clamping hub, single slotted, without feather keyway

Frictionally engaged, backlash-free shaft-hub-connection-. Transmittable torques depending on bore diameter Design 2.0 up to size 14 as standard. (Only for ATEX category 3)

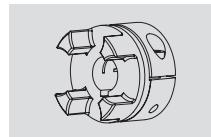

Design 2.1 clamping hub, single slotted, with feather keyway

Positive locking power transmission with additional frictionally engaged condition. The frictionally engaged condition prevents or reduces reverse backlash, respectively. Surface pressure of the keyway connection is reduced. Design 2.1 up to size 14 as standard.

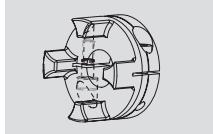

Design 2.5 clamping hub, double slotted, without feather keyway

Frictionally engaged, backlash-free shaft-hub-connection-. Transmittable torques depending on bore diameter Design 2.5 from size 19 as standard. (Only for ATEX category 3)

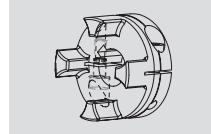

Design 2.6 clamping hub, double slotted, with feather keyway

Positive locking power transmission with additional frictionally engaged condition. The frictionally engaged condition prevents or reduces reverse backlash, respectively. Surface pressure of the keyway connection is reduced. Design 2.6 from size 19 as standard.

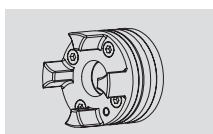

Design 2.8 short clamping hub C with axial slots without feather keyway

Frictionally engaged, backlash-free shaft-hub-connection-, good properties of concentric running. Transmittable torques depending on bore diameter Design 2.8 up to size 24 as standard. Size 7-19 type 2.8 single slotted (Only for ATEX category 3)

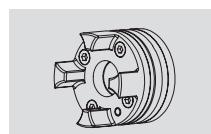

Design 2.9 short clamping hub C with axial slots with feather keyway

Positive locking power transmission with additional frictionally engaged condition. The surface pressure of the feather key combination is reduced. Type 2.9 from size 24 as standard. Size 7-19 type 2.9 single slotted.

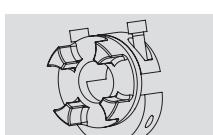

Design 6.0 clamping ring hub

Integrated frictionally engaged shaft-hub-connection for the transmission of higher torques. Screwing on elastomer side. For torques and dimensions see page 156/157. Suitable for high speeds.

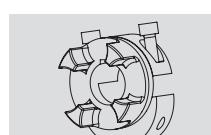

Design 6.0 P precision clamping ring hub

Design equal to 6.0, but highly accurate machining with slight modifications of design, see page 158.

Design 7.5 clamping hub type DH without feather keyway for double-cardanic connections

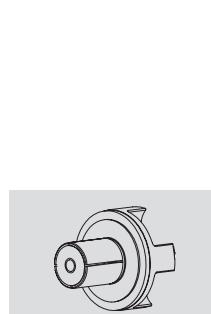

Frictionally engaged, backlash-free shaft-hub-connection for radial assembly of coupling. Transmittable torques depending on bore diameter For torques see page 162.

Design 7.6 clamping hub type DH with feather keyway for double-cardanic connections

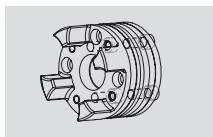

Positive shaft-hub connection with additional frictional engagement for the radial assembly of the coupling. The frictional engagement avoids or reduces the reverse backlash. The surface pressure of the feather key connection is reduced.

Design 7.8 clamping hub type H without feather keyway, single-cardanic connection

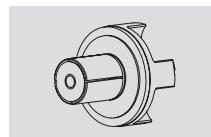

Design 7.9 clamping hub type H with feather keyway for single-cardanic connection

Special designs on request of customers

Design 6.5 clamping ring hub

Design equal to 6.0, but clamping screws on the outside. As an example for radial disassembly of intermediate pipe (special design).

Design 9.0 Expansion hub

Frictionally engaged connection for hollow shaft. Transmittable torques depend on the bore diameter and the hollow shaft.

Bores on demand

Standard types

- Backlash-free shaft connection under prestress
- Small dimensions – low flywheel mass
- Maintenance-free, easy to check visually
- Various kinds of elastomer hardness of spiders (see page 146)
- Finish bore according to ISO fit H7 (except for clamping hub), feather key optionally available from Ø 6 mm according to DIN 6885 sheet 1 – JS9.
- Approved according to EC Standard 94/9/EC (without feather key according to category 3)

Clamping ring hubs light

- Backlash-free shaft coupling with integrated clamping system
- As an example, use on feed/main spindles, drives on machine tools, handling units, etc.
- Low weight and low mass moment of inertia due to a design fully made from aluminium
- Easy assembly due to internal clamping screws and block assembly
- High friction torques
- High smoothness of running, application up to a peripheral speed of 50 m/s
- Approved and certified according to EC Standard 94/9/EC

* The transmittable torques of the clamping connection consider the max. clearance with shaft fit k6 / bore H7. With bigger clearance the torque is reduced. As shaft material steel or nodular iron with a yield point of approx. 250 N/mm² or more can be used. For the stiffness calculation of the shaft/hollow shaft see KTR standard 45510 at our homepage www.ktr.com.

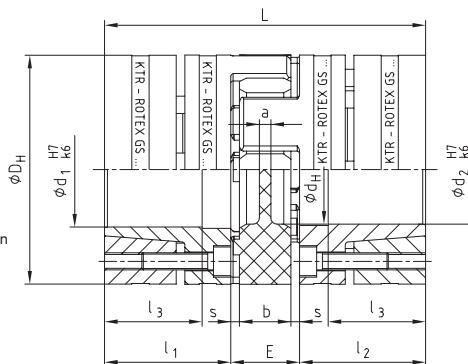

Ordering example:

ROTEX® GS 24	98 Sh-A-GS	d20	6.0 light – Ø 24	6.0 light – Ø 20
Coupling size	Spider hardness	Optional: Bore diameter in spider	Hub design	Finish bore

Clamping ring hubs steel

- Backlash-free shaft coupling with integrated clamping system
- As an example, use on gearboxes and other drives with high torque shocks
- High running smoothness, application up to a peripheral speed of 40 m/s
- For high friction torques (consider the selection in case of explosion protection use)
- Easy to assemble due to internal clamping screws
- Finish bore up to Ø 50 mm according to ISO fit H7, from Ø 55 mm according to ISO fit G7
- Approved and certified according to EC Standard 94/9/EC

* The transmittable torques of the clamping connection take into account the max. clearance with shaft fit k6 / bore H7, from Ø55 G7/m6. With bigger clearance the torque is reduced. For the stiffness calculation of the shaft/hollow shaft see KTR standard 45510 at our homepage at www.ktr.com.

Special design for external assembly of the screws

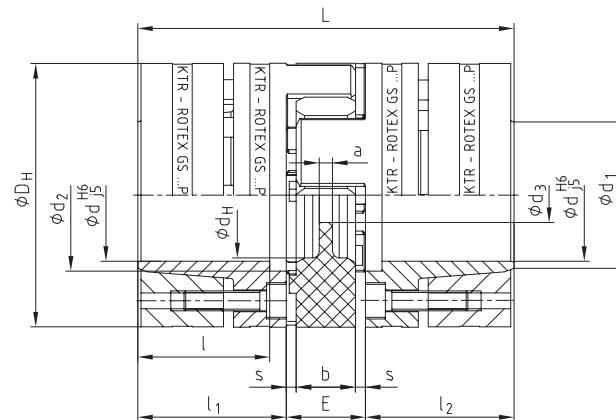

Ordering example:	ROTEX® GS 24	98 Sh-A-GS	d20	6.0 Steel	Ø24	6.0 Steel	Ø20
Coupling size	Coupling size	Spider hardness	Optional: Bore diameter in spider	Hub design	Finish bore	Hub design	Finish bore

Type P according to DIN 69002

- Backlash-free, highly accurate shaft coupling with integrated clamping system
- Developed specifically for stub spindles on multiple spindle heads according to DIN 69002
- Application on main spindle drives with high speeds, peripheral speeds of 50 m/s and more (please consult with KTR engineering department)
- For high friction torques (consider the selection in case of explosion protection use)
- Easy to assemble due to internal clamping screws
- Approved and certified according to EC Standard 94/9/EC Certificate ATEX 95)

Intermediate shaft coupling

- Use with lifting machines, in handling units, robotic palletisers etc.
- Easy, radial coupling assembly because of split coupling hub, replacement of spiders without shifting the driving and driven side
- Lengths are possible up to 4 m without intermediate bearing dependent on speed and size
- Low mass moment of inertia by using aluminium
- Can be combined with other hub designs
- Finish bore according to ISO fit H7, keyway according to DIN 6885 sheet 1 - JS9

¹⁾ Further spiders/selection see page 148-151

²⁾ With dmax.

³⁾ Torsion spring stiffness with an intermediate pipe of a length of 1 m, LPipe being = LZR - 2 · L

For enquiries and orders please mention the shaft distance dimension LR along with the maximum speed to review the critical bending speed.

The intermediate pipe could be combined with other hub designs, but in that case it can no longer be radially disassembled. Please mention the shaft distance dimension required in your order.

Hub design 7.5 clamping hub type DH without feather keyway

Hub design 7.6 clamping hub type DH with feather keyway

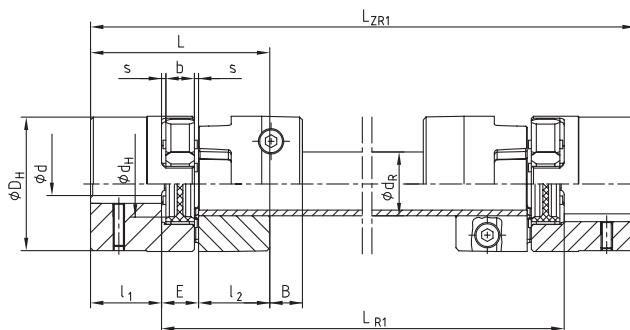

With vertical application a support washer has to be used (please mention in your order).

Ordering example:	ROTEX® GS 24	ZR3	1200 mm	98 Sh A-GS	7.5 - Ø24		7.5 - Ø24	
	Coupling size	Type	Shaft distance dimension (LR)	Spider hardness	Hub design	Finish bore	Hub design	Finish bore

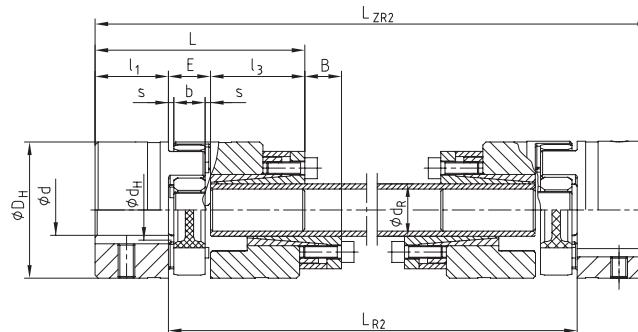

Intermediate shaft coupling

- Backlash-free intermediate shaft coupling
- Application, for example, on lifting spindle elements, parallel linear systems, overhead gantry robots, handling machines
- For connection of larger shaft distances and a maximum speed of 1500 rpm
- Spacer part to be disassembled radially
- Design ZR1 for torques up to the maximum friction torque of clamping hub, design ZR2 for higher torques
- Finish bore according to ISO fit H7 (apart from clamping hub), keyway, from Ø 6 mm according to DIN 6885 sheet 1 - JS9

¹⁾ Radial displacements based on a coupling length $L_{ZR} = 1000$ mm

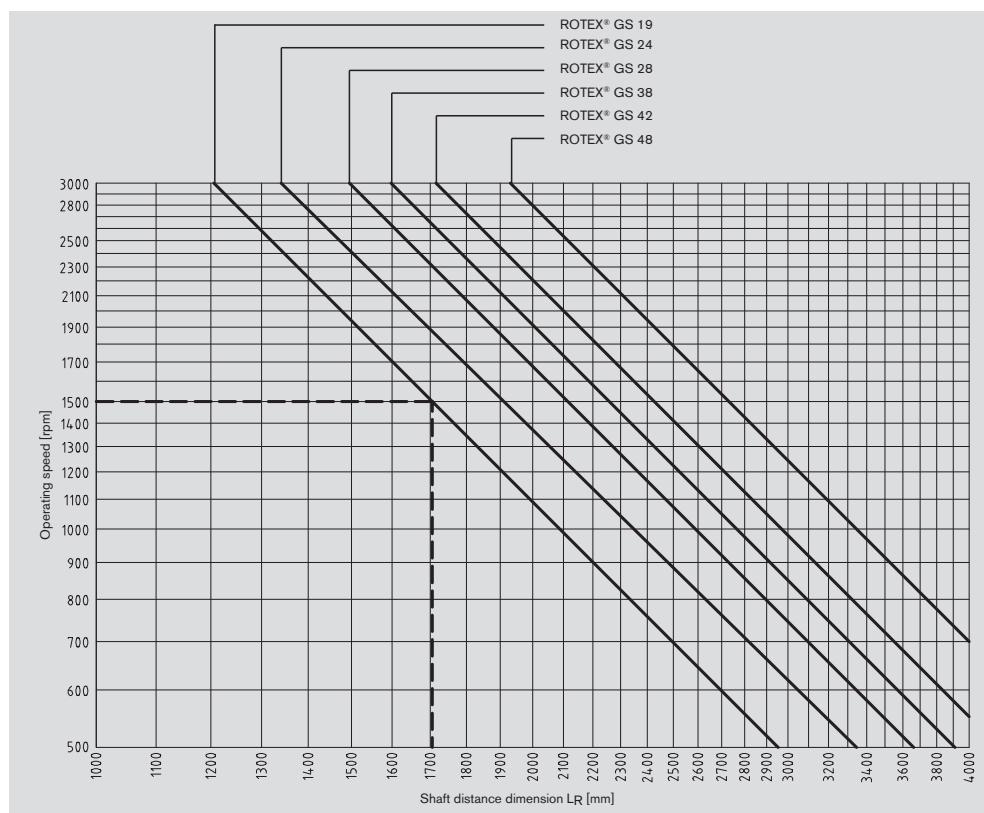

Calculation of overall torsion spring stiffness:

$$C_{\text{total}} = 1 / (2 \cdot (1 / C_1) + (L_{\text{pipe}} / C_2)) \text{ [Nm/rad]}$$

$$L_{\text{pipe}} = (L_{ZR} - 2 \cdot L) / 1000 \text{ [m]}$$

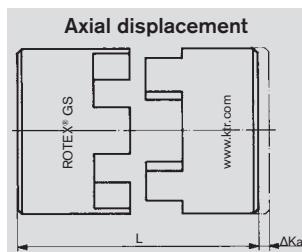

C_1 = torsion spring stiffness for spider see page 148
 C_2 = refer to table on page 162/163

Chart of critical bending speeds for design ZR3

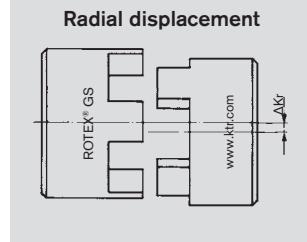

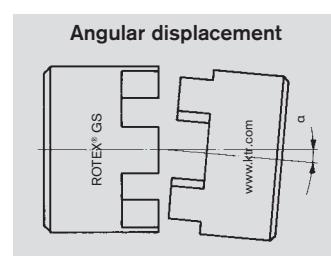

Displacements

Due to its design the ROTEX® GS is able to absorb axial, angular and radial displacement, without causing any wear or premature failure of the coupling. As the spider is only stressed under pressure it is ensured that the coupling will remain backlash-free even after a longer operation period.

As an example, axial displacement may be produced by different tolerances of the connecting elements during the assembly or by alteration of the shaft length if fluctuation of temperature occurs. As the shaft bearings usually cannot be axially stressed to a big extent, it is the task of the coupling to compensate for this axial displacement and to keep the reaction forces low.

In case of pure angular displacement the imagined bisecting lines of the shafts intersect in the middle of the coupling. Up to a certain permissible extent this displacement can be absorbed by the coupling without any danger of extensive restoring forces.

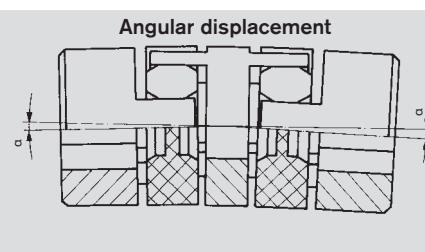

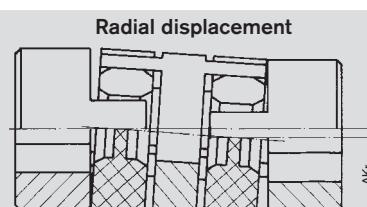

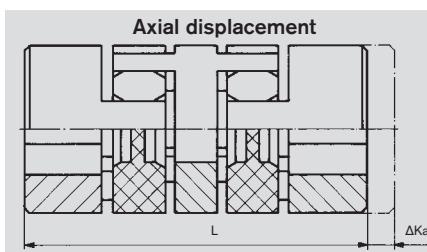

Radial displacement results from parallel displacement of the shafts towards each other, caused by different tolerances at the centerings or by mounting of the power packs on different levels. Due to the kind of displacement the largest restoring forces are produced here, con-

sequently causing the highest stresses for the adjacent components. In case of larger displacements (especially radial displacements) the ROTEX® GS DKM double cardanic design should be applied in order to avoid excessive restoring forces.

The above-mentioned permissible displacement figures of the flexible ROTEX® GS couplings are standard values, taking into account the coupling load up to the rated torque T_{KN} of the coupling and with an ambient temperature of + 30 °C. The displacement figures may only be used individually - if they arise simultaneously, they must be used proportionately. The ROTEX® GS couplings are in a position to compensate for radial and angular displacements. Careful and accurate alignment of the shafts increases the service life of the coupling.

Shaft misalignment ROTEX® GS type DKM

This design reduces the restoring forces arising with radial displacement to a minimum, due to the double-jointed operation, additionally the coupling is able to compensate for higher axial and angular misalignment.

Double-cardanic for measuring drives

- Backlash-free shaft coupling for measurement drives with small torques
- 3-parted double-cardanic coupling
- Small dimensions - low flywheel mass
- Axial plug-in – easy blind assembly
- Available from stock with usual shaft dimensions
- Temperature range -40 °C to +160 °C
- Electric insulation
- Finish bore acc. to ISO fit H7, keyway from Ø 6 mm acc. to DIN 6885 sheet 1 - JS9
- Applicable to circumferential speeds up to 40 m/s (higher speeds on request)

General description

COUNTEX® is a three-parted, backlash-free and torsionally stiff coupling mainly used in measuring and control technology. Its axial plug-in ability combined with the geometry of hubs results in a coupling system with a specifically easy assembly offering options of mounting fitting with processing. The material of the spacer is resistant to high temperatures ensuring almost continuous properties of the coupling system even with temperatures up to 160 °C.

Measuring and control technology

The measuring and control technology demands for a high torsion spring stiffness of the coupling in order to realize reproducible positioning.

The torques that arise are relatively low so that a backlash-free, torsional stiff power transmission is achieved subject to the prestress. The double-cardanic principle of COUNTEX® reduces the restoring forces to a minimum.

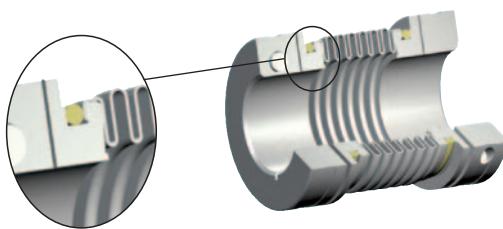

Ordering example:

COUNTEX® 14	Ø6,35	Ø10
Coupling size	Finish bore Ød1	Finish bore Ød2

Coupling description

TOOLFLEX® is a metal bellow-type coupling, a coupling system which has proven its worth in the field in many cases. The metal bellow compensates perfectly for axial, radial and angular displacements. At the same time its geometric shape allows for high torsional stiffness and a low mass moment of inertia. TOOLFLEX® is manufactured in twelve sizes for maximum torques up to 600 Nm. Its main application ranges are both positioning drives, e. g. ball spindles with a high incline, and indexing tables or planetary and worm gears with small gear ratios.

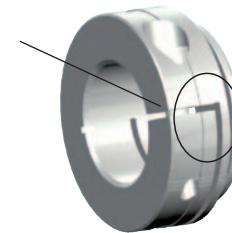

Subject to its well-proven joint procedure a non-positive, backlash-free connection of the aluminium hubs with the multilayer bellows made from stainless steel is produced. The flanged insert connection for sizes 16 to 45 ensures a torque transmission of every single bellow layer. Since TOOLFLEX® is a metal coupling, it remains fatigue-endurable in the high temperature range up to a maximum of 200 °C. Apart from that it is resistant to the effect of media or critical operating conditions, respectively.

The well-known shaft-hub-connection by means of clamping hubs ensures an easy assembly by a radial clamping screw.

Subject to two slots in the hub there is no deformation of the bellow when tightening the clamping screw.

For higher friction torques type KN with taper hubs can be used.

clamping hub with two slots

Coupling selection

Normally the TOOLFLEX® is selected according to the nominal torque (T_{KN}) shown in the list of technical data, like all other coupling systems. In all cases the torque (T_{KN}) must exceed the maximum peak torque of the machine to be transmitted (accelerating or peak torque). This should mainly be considered in connection with servo motors because their accelerating torques both positive and negative can exceed the nominal torque of the coupling by a significant amount. In case of values exceeding T_{KN} (collision, trouble) only limited alternating load figures are possible. In this torque range there can be permanent deformation of the bellow and fatigue fractures can occur. The torques T_{KN}/T_{Kmax} mentioned refer to the bellow. The shaft-hub-connection has to be investigated by the customer.

Description	Symbol	Definition or explanation	Description	Symbol	Definition or explanation
Rated torque of coupling	T_{KN}	Torque that can continuously be transmitted over the entire permissible speed range	max. engine performance	$P_{max.}$	max. power in kW which the engine may produce
Maximum torque of coupling	T_{Kmax}	Torque which can be transmitted short-term (e.g. emergency shut down). $T_{Kmax} = 1,5 \cdot T_{KN}$	engine speed	n	Rated speed in rpm of the engine
Peak torque of machine	T_S	Peak torque on the coupling	Twisting angle	ϕ	Transmission error in degrees of the metal bellow due to torsional strain
Peak torque on the driving side	T_{AS}	Peak torque with torque shock on the driving side, e. g. breakdown torque of the electric motor	Torsional stiffness	C_T	Torsional stiffness of the coupling in Nm/rad. for data see tables shown on the following pages.
Peak torque of load side	T_{LS}	Peak torque with torque shock on load side, e. g. braking	Frequency of the 2-mass-system	f_e	in s^{-1}
Moment of inertia	J_A/L	Total of moments of inertia existing on the driving or load side referring to the coupling speed	Exciting frequency of the drive	f_r	in s^{-1}
Rotational inertia coefficient of driving side	m_A	Factor taking into account the mass distribution with shocks and vibrations produced on the driving side	Operating factor	k	$k= 1.5$ with uniform movement $k= 2.0$ with nonuniform movement $k= 2.5 - 4$ with shocking movement For drives on machine tools (servo motors) k values of 1.5 - 2 must be used.
Rotational inertia coefficient of load side	m_L	Factor taking into account the mass distribution with shocks and vibrations produced on the load side	Screw tightening torque	T_A	Tightening torque of screw
Friction torque	T_R	Torque that can be transmitted through the frictionally engaged shaft-hub-connection			

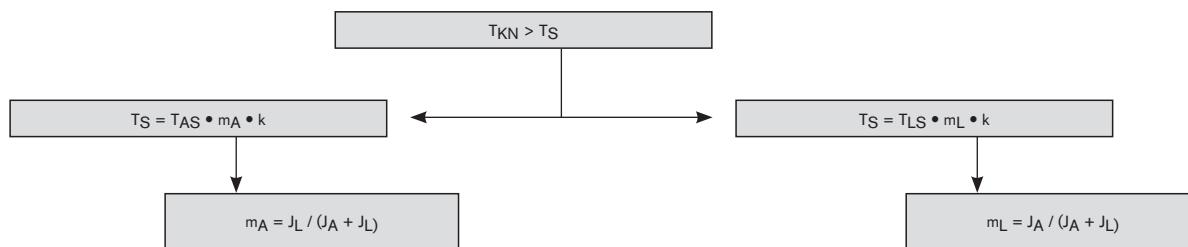

Approximate calculation

The size of the coupling must be selected so that the following conditions are met.

When selecting servo motors the calculations are made with the torque values of the engine suppliers and not with P_{max} . When dimensioning the coupling please use the respective data of the manufacturer considering the servo controller to be used.

Calculation based on accelerating torque (drive side / load side)

Inspection of torsional stiffness

$$\phi = (180 \cdot T_{AS}) / (\pi \cdot C_T)$$

Inspection of resonance frequency

The natural frequency of the coupling must be above or below the frequency of the machine. The following applies for the mechanical homologous model of the 2-mass-system:

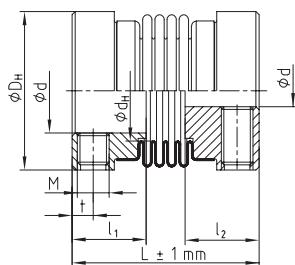

$$f_e = 1 / (2 \cdot \pi) \cdot \sqrt{(C_T \cdot (J_L + J_A) / (J_L \cdot J_A))} [\text{Hz}]$$

Valid in practice: $f_e \geq 2 \cdot f_r$

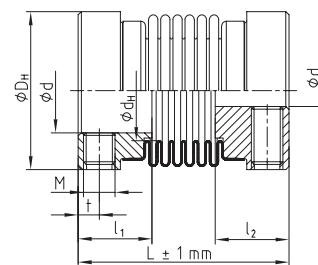

Type S and M with thread for setscrews

- Backlash-free, torsionally stiff
- Maintenance-free
- Low mass moment of inertia
- Easy assembly due to tolerance F7
- Temperature range for size 5 to 12: -30 °C to +100 °C
- Temperature range for size 16 to 20: max. 200 °C
- Finish bore from Ø 6 mm also available with feather key acc. to DIN 6885 sheet 1 – JS9

¹⁾ Design S = 4 section bellows²⁾ Design M = 6 section bellows³⁾ For selection see page 168⁴⁾ Quantity each hub, from size 9: 2x120° offset⁵⁾ Figures refer to the complete coupling with max. boresCircumferential speed v_{max}= 20 m/s

Hub design 1.1= hub without keyway with thread for set screws.

Hub design 1.0= hub with keyway with thread for set screws.

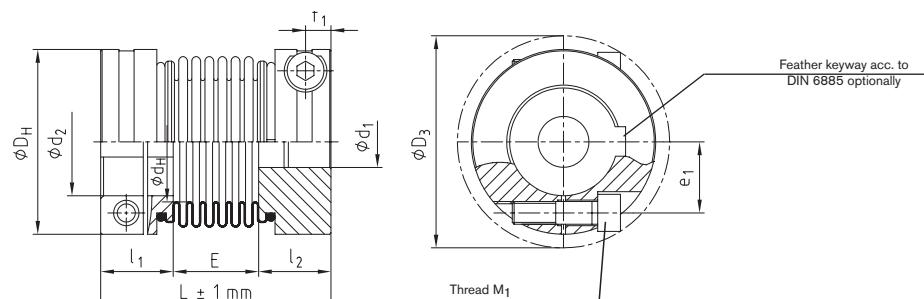

Ordering example:

TOOLFLEX® 7 M	1.1 - Ø4		1.1 - Ø6	
Coupling size	Hub design	Finish bore	Hub design	Finish bore

Type M with clamping hubs

- Backlash-free, torsionally stiff
- Frictionally engaged clamping hubs
- Maintenance-free
- Temperature range:
for size 5 to 12: -30 °C to +100 °C
from size 16: suitable for high temperatures due to flanged insert connection (max. 200 °C)
- Good resistance to corrosion
- Finish bore from Ø 6 mm also available with feather key acc. to DIN 6885 sheet 1 – JS9

Ordering example:

TOOLFLEX® 38 S-KN	Ø15	Ø22
Coupling size	Finish bore	Finish bore

Type PI

- Axial plug-in
- Backlash-free, torsionally stiff
- Maintenance-free
- Suitable for high temperatures due to flanged insert connection
- Good resistance to corrosion due to bellow made of stainless steel and aluminium clamping hubs
- Optionally type M (6 section bellows)
 - higher perm. displacements
- or Type S (4 section bellows, short design)
 - higher stiffness of torsion spring
 - lower mass moment of inertia

Coupling description

RADEX®-NC is a line particularly developed for servo technology. In this coupling a package of torsionally rigid steel laminas that are soft in bending ensures a reliable compensation for axial, angular and radial shaft displacements. As an all-metal coupling - the laminas are made of stainless steel - RADEX®-NC can even be used with high temperatures (up to 200 °C) and under aggressive ambient conditions. The RADEX®-NC is manufactured in 7 sizes from size 5 to 42 for max. torques of up to 360 Nm. The hubs are frictionally engaged clamping hubs made of aluminium (size 42 made of steel) and are thus backlash-free even in a reversing drive.

A typical application of the RADEX®-NC are backlash-free worm gear pairs with low transmissions. The rigidity of the coupling must be converted by reason of the transmission of the gearbox from the drive side to the driven side. Here the transmission itself has a decisive influence because it is squarely included in the calculation. This converted rigidity is added in line to the gearbox stiffness in order to get the total rigidity. In case of transmissions that are lower than $i = 8$ we recommend to use the RADEX®-NC due to the loss of rigidity of the total system arising if flexible couplings are used.

Explosion protection use

RADEX®-NC couplings are suitable for power transmission in drives in hazardous areas. The couplings are certified and confirmed according to EC standard 94/9/EC (ATEX 95) as units of category 2G/2D and thus suitable for the use in hazardous areas of zone 1, 2, 21 and 22. Please read through our information included in the respective Type Examination Certificate and the operating and mounting instructions at www.ktr.com.

Selection:

In case of use in hazardous areas the clamping hubs without feather key, only for use in category 3 (with feather key for category 2), must be selected in a way that there is a minimum safety factor of $s = 2$ between the peak torque (including all operating parameters) and the nominal torque and frictional torque of engagement of the coupling.

Coupling selection

Normally the RADEX®-NC is selected according to the nominal torque (T_{KN}) shown in the list of technical data, like all other coupling systems. In all cases the torque (T_{KN}) must exceed the maximum peak torque of the machine to be transmitted (accelerating or peak torque). This should mainly be considered in connection with servo motors because their accelerating torques both positive and negative can exceed the nominal torque of the coupling by a significant amount. In case of values exceeding T_{KN} (collision, trouble) only limited alternating load figures are possible. The torques T_{KN}/T_{Kmax} mentioned refer to the lamina set. The shaft-hub-connection has to be investigated by the customer.

Description	Symbol	Definition or explanation
Rated torque of coupling	T_{KN}	Torque that can be continuously transmitted over the entire permissible speed range.
Maximum torque of coupling	T_{Kmax}	Torque which can be transmitted short-term (e.g. emergency shut down) $T_{Kmax} = 1,5 \cdot T_{KN}$
Peak torque of machine	T_S	Peak torque on the coupling
Peak torque on the driving side	T_{AS}	Peak torque with torque shock on driving side, e. g. breakdown torque of the electric motor.
Peak torque of load side	T_{LS}	Peak torque with torque shock on load side, e. g. braking
Moment of inertia	$J_{A/L}$	Total of moments of inertia existing on the driving or load side referring to the coupling speed
Rotational inertia coefficient of driving side	m_A	Factor taking into account the mass distribution with shocks and vibrations produced on the driving side
Rotational inertia coefficient of load side	m_L	Factor taking into account the mass distribution with shocks and vibrations produced on the load side
Friction torque	T_R	Torque that can be transmitted through the frictionally engaged shaft-hub-connection

Description	Symbol	Definition or explanation
max. engine performance	$P_{max.}$	Maximum power in kW that can be produced by the motor
engine speed	n	Rated speed in rpm of the engine
Twisting angle	ϕ	Transmission error in degrees of the metal bellow due to torsional strain
Torsional stiffness	C_T	Torsional stiffness of the coupling in Nm/rad. For data see tables shown on the following pages.
Excitation frequency of the 2-mass-system	f_e	in s-1
Exciting frequency of the drive	f_r	in s-1
Operating factor	k	$k = 1.5$ with uniform movement $k = 2.0$ with nonuniform movement $k = 2.5 - 4$ with shocking movement For drives on machine tools (servo motors) k values of 1.5 - 2 must be used.
Screw tightening torque	T_A	Tightening torque of screw

Approximate calculation

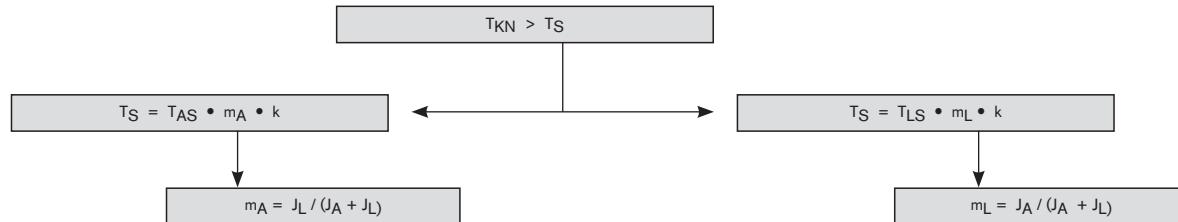

The size of the coupling must be selected so that the following conditions are met.

$$T_{KN} \geq T_{AS/LS} \cdot k$$

$$T_{AS} [\text{Nm}] = 9550 \cdot P_{max} [\text{kW}] / n [\text{rpm}]$$

When selecting servo motors the calculations are made with the torque values of the engine suppliers and not with P_{max} . When dimensioning the coupling please use the respective data of the manufacturer considering the servo controller to be used.

Calculation of accelerating torque (drive side / load side)

Inspection of torsional stiffness

$$\phi = (180 \cdot T_{AS}) / (\pi \cdot C_T)$$

Inspection of resonance frequency

The resonance frequency of the coupling must be above or below the frequency of the machine. Valid for the mechanical spare model of the 2-mass-system:

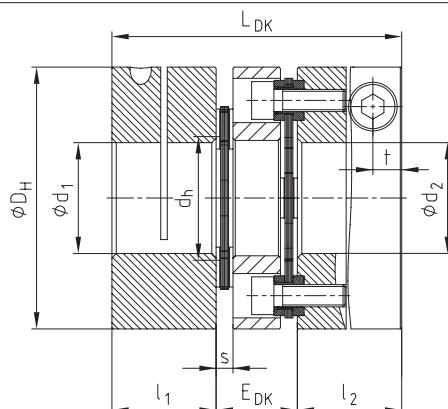

$$f_e = 1 / (2 \cdot \pi) \cdot \sqrt{(C_T \cdot ((J_L + J_A) / (J_L \cdot J_A)))} [\text{Hz}]$$

Valid in practice: $f_e \geq 2 \cdot f_r$

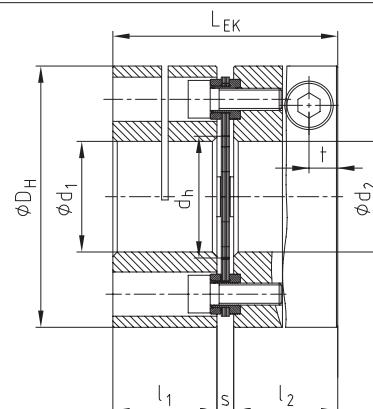

Standard types

- Backlash-free torque transmission
- Higher torsional rigidity
- Backlash-free shaft-hub-connection
- Low mass moment of inertia
- High speeds
- Operating temperature up to 200 °C
- Compact type
- Finish bore from Ø 6 mm also available with feather key acc. to DIN 6885 sheet 1 – JS9
- Approved and confirmed according to EC Standard 94/9/EC (Explosion Certificate ATEX 95) (without feather key only for category 3)
